Mechanical Equipment
Interface Standard, IPC,
Rev. 2007

*IPC-SMEMA Standard 9851

Challenges: The Situation before The Hermes Standard

How does SMEMA* work?

SMEMA reflects the state-of-the-art in automation... of the early 1990s.

Source: IPC SMEMA 9851
Mechanical Equipment
Interface Standard, IPC,
Rev. 2007

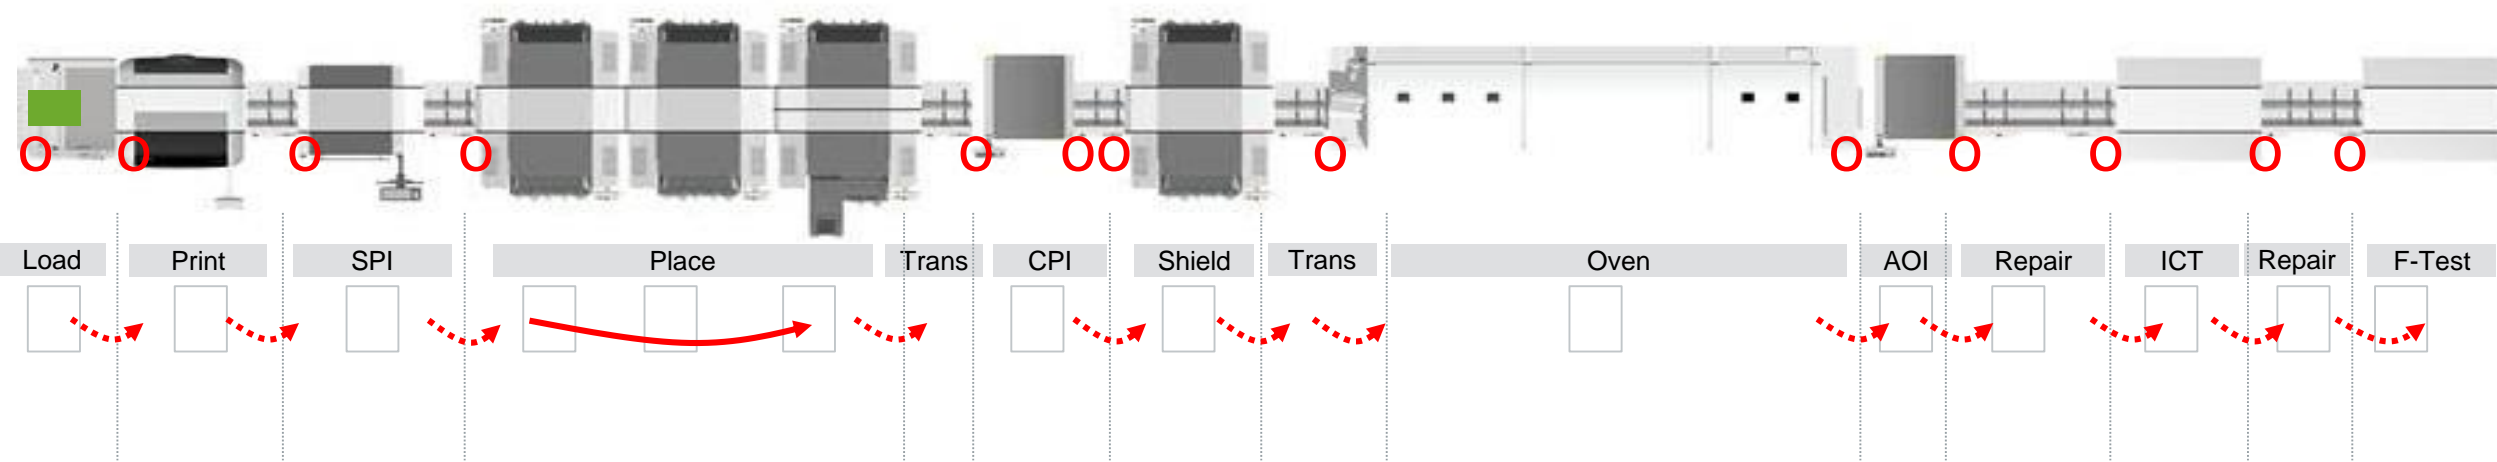

*IPC-SMEMA Standard 9851

Challenges: The Situation before The Hermes Standard

How does SMEMA* work?

E.g.: PCB identification

In mixed vendor lines,
ID readers were required
before each machine

○ Board ID Scanning required

*IPC-SMEMA Standard 9851

Challenges: The Situation before The Hermes Standard

High level line control was burdened with additional load and complexity

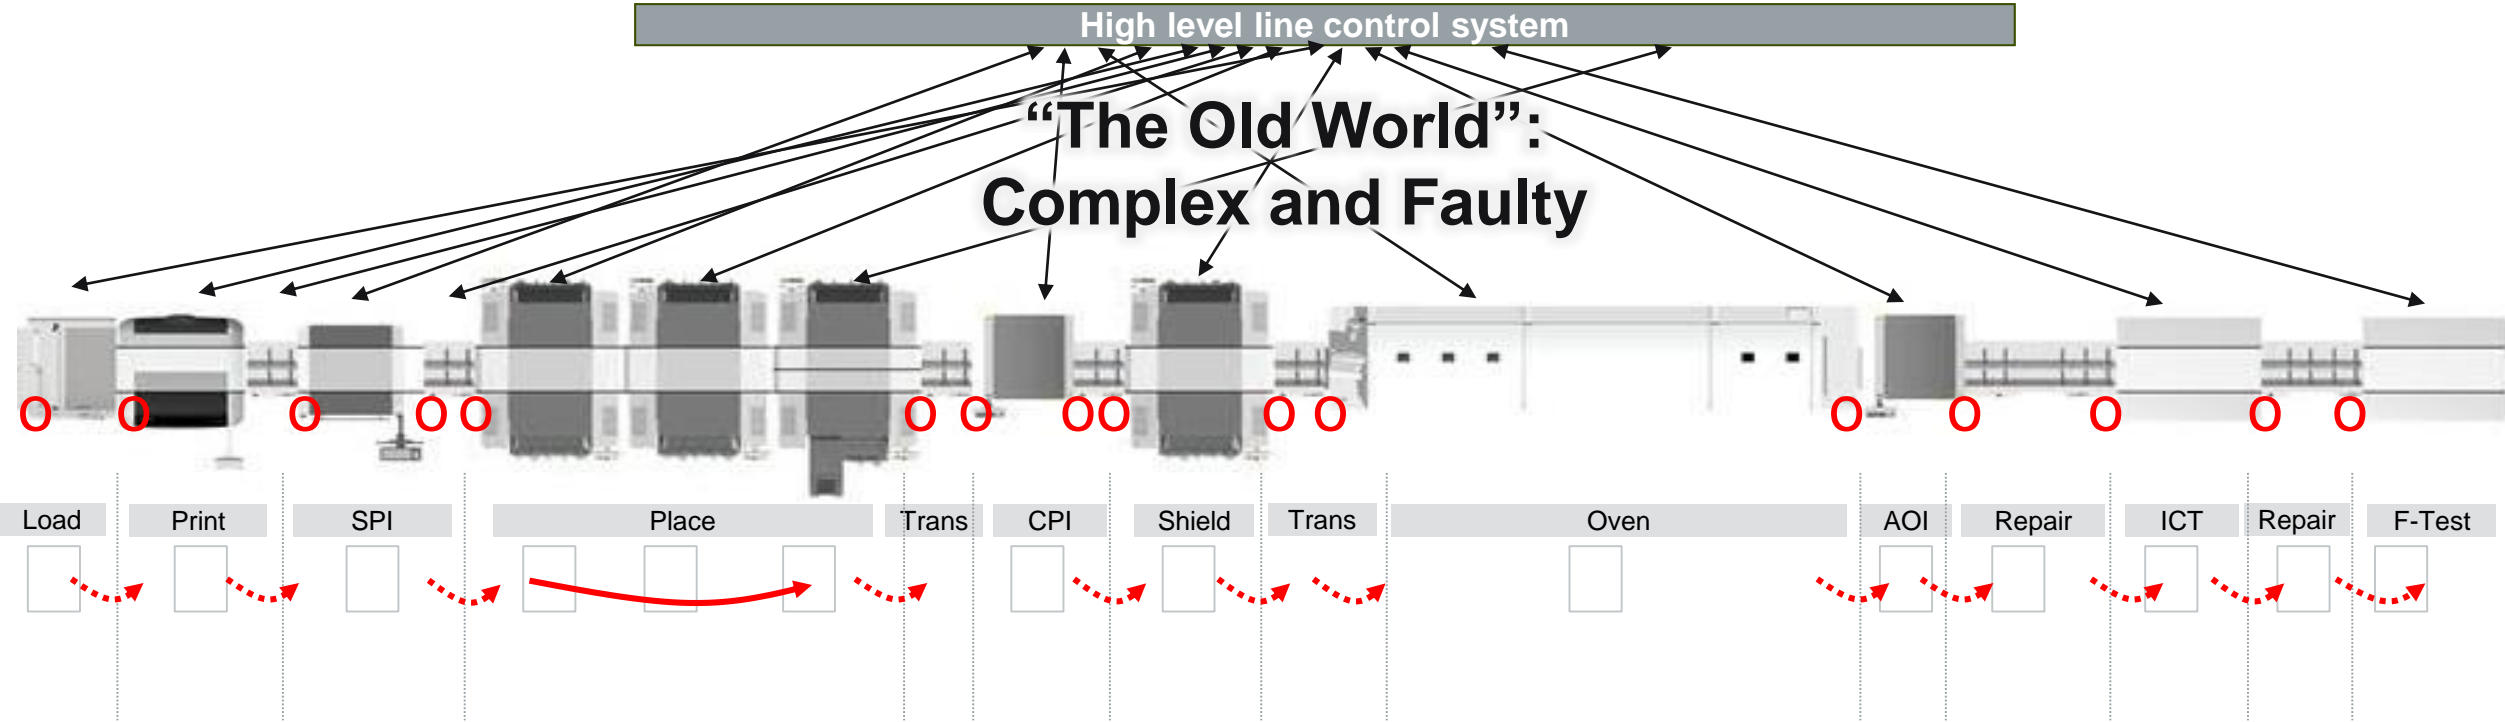

○ Board ID Scanning required

Challenges: The Situation before The Hermes Standard

High level line control was burdened with additional load and complexity

No data available, no closed loop handover.

- o Board ID Scanning required

“Old” versus “New”

SMEMA cannot be upgraded to unleash the options of latest technology

IPC-SMEMA-9851

- Multiple cable types. At least 4 different types of cables: Plug – Pin, Plug – socket, Plug – plug and Pin – pin
- Rather expensive due to dedicated HW requirements.
- Need to check each machine to connect for getting the right cable
- Additional information needs to be modulated on the hardware signals
- There is no general system to keep additional information through several machines

SMEMA was leading edge process technology when defined, but it offers no option for “the future”

"Old" versus "New" The Hermes Standard: New Generation Technology

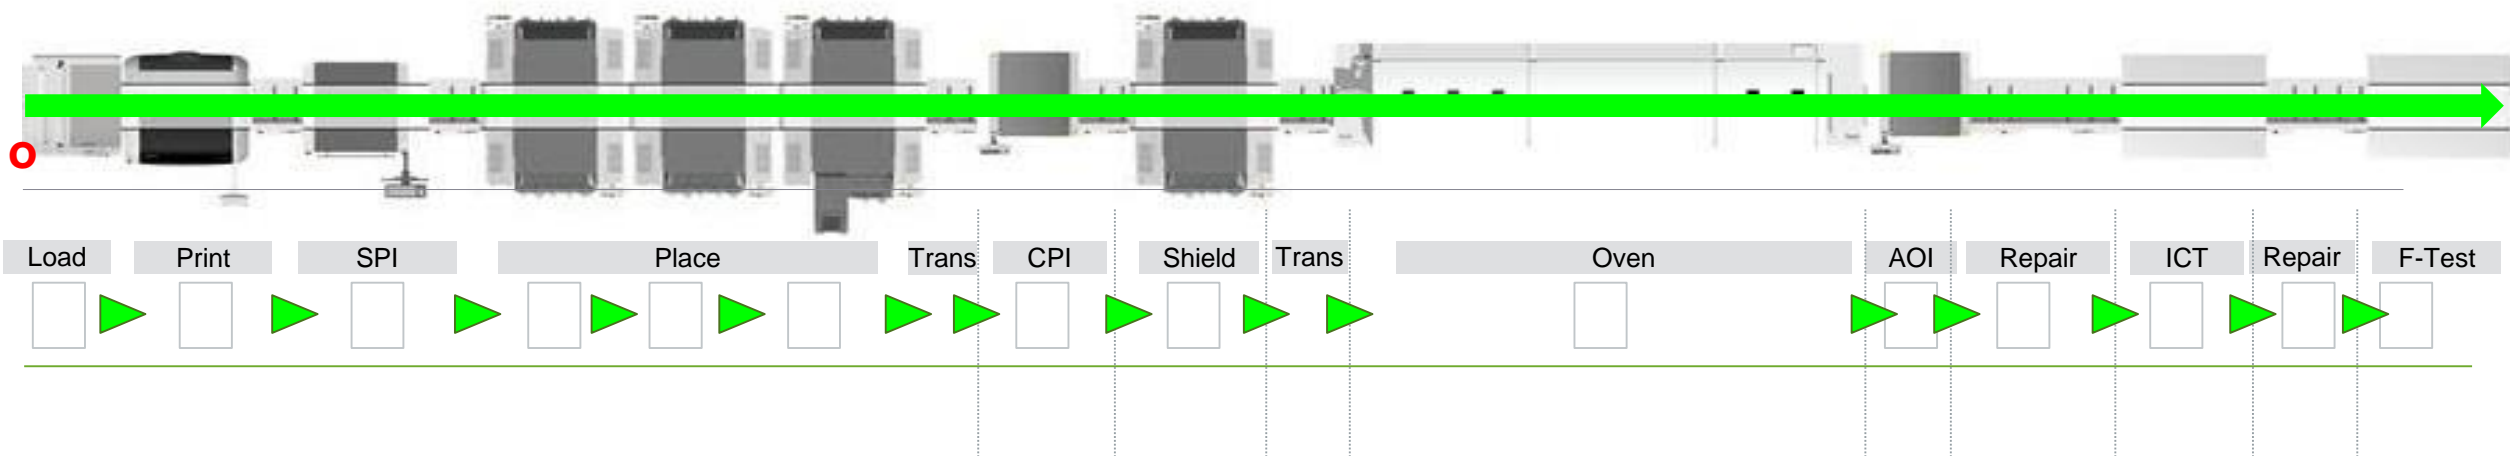

Why is The Hermes Standard the better solution?

- **Protocol based** instead of "signal based":
Easy to adjust and easy to expand for integrating further information.
- **Standard components** instead of "special needs":
Cables, plugs and interfaces inexpensive and easily available .
- **Integrated data management** versus separation:
Consistent board and data assignment.

The Hermes Standard (IPC-HERMES-9852)

Full Process data availability, maximum line throughput & traceability.

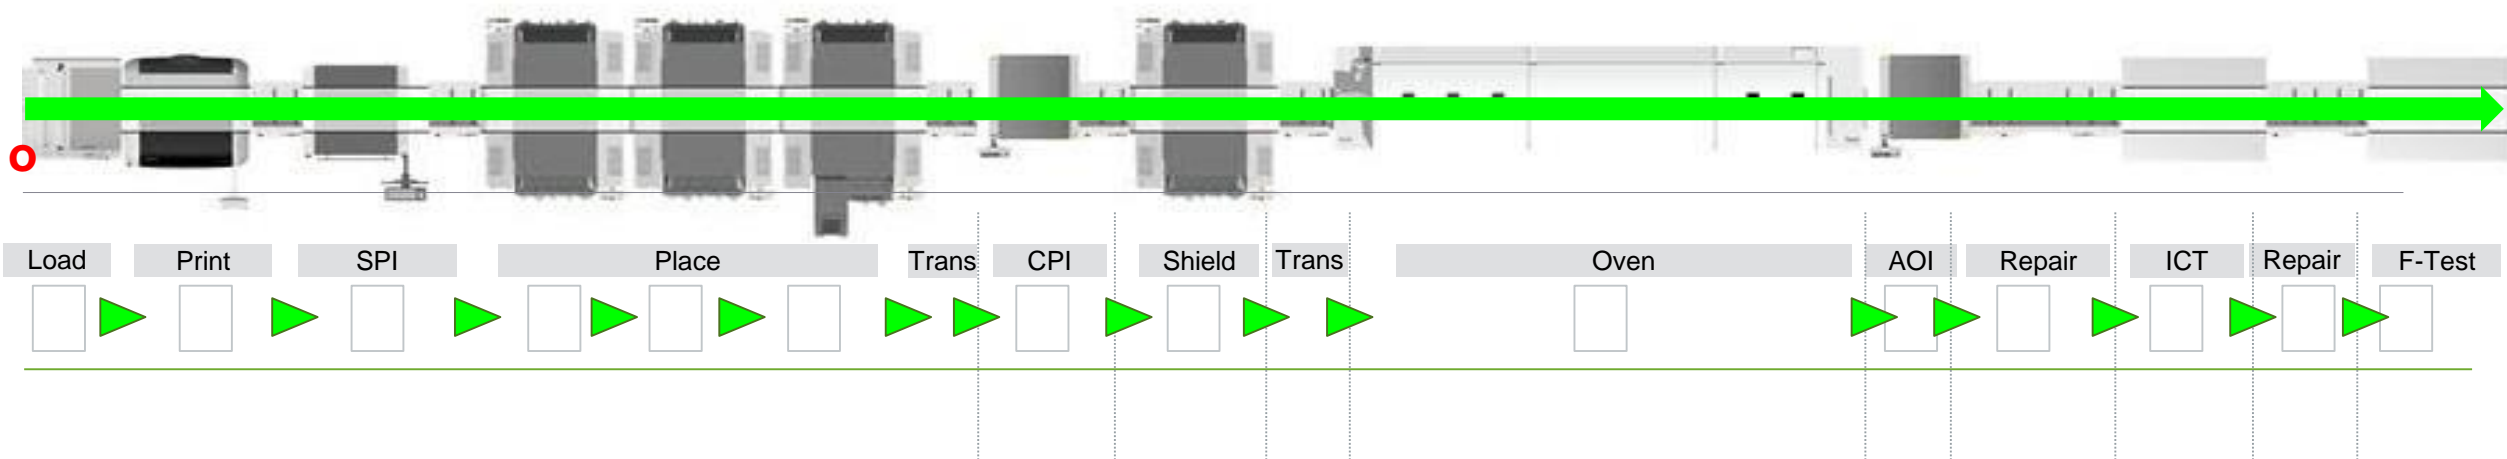

► Standardized M to M Interface
via The Hermes Standard

○ Need for board identification (Barcode scanning / RFID reading, etc) only once per line and typically at the beginning:

The Hermes Standard (IPC-HERMES-9852)

Full Process data availability, maximum line throughput & traceability.

The product drives the change!

The Hermes Standard (IPC-HERMES-9852)

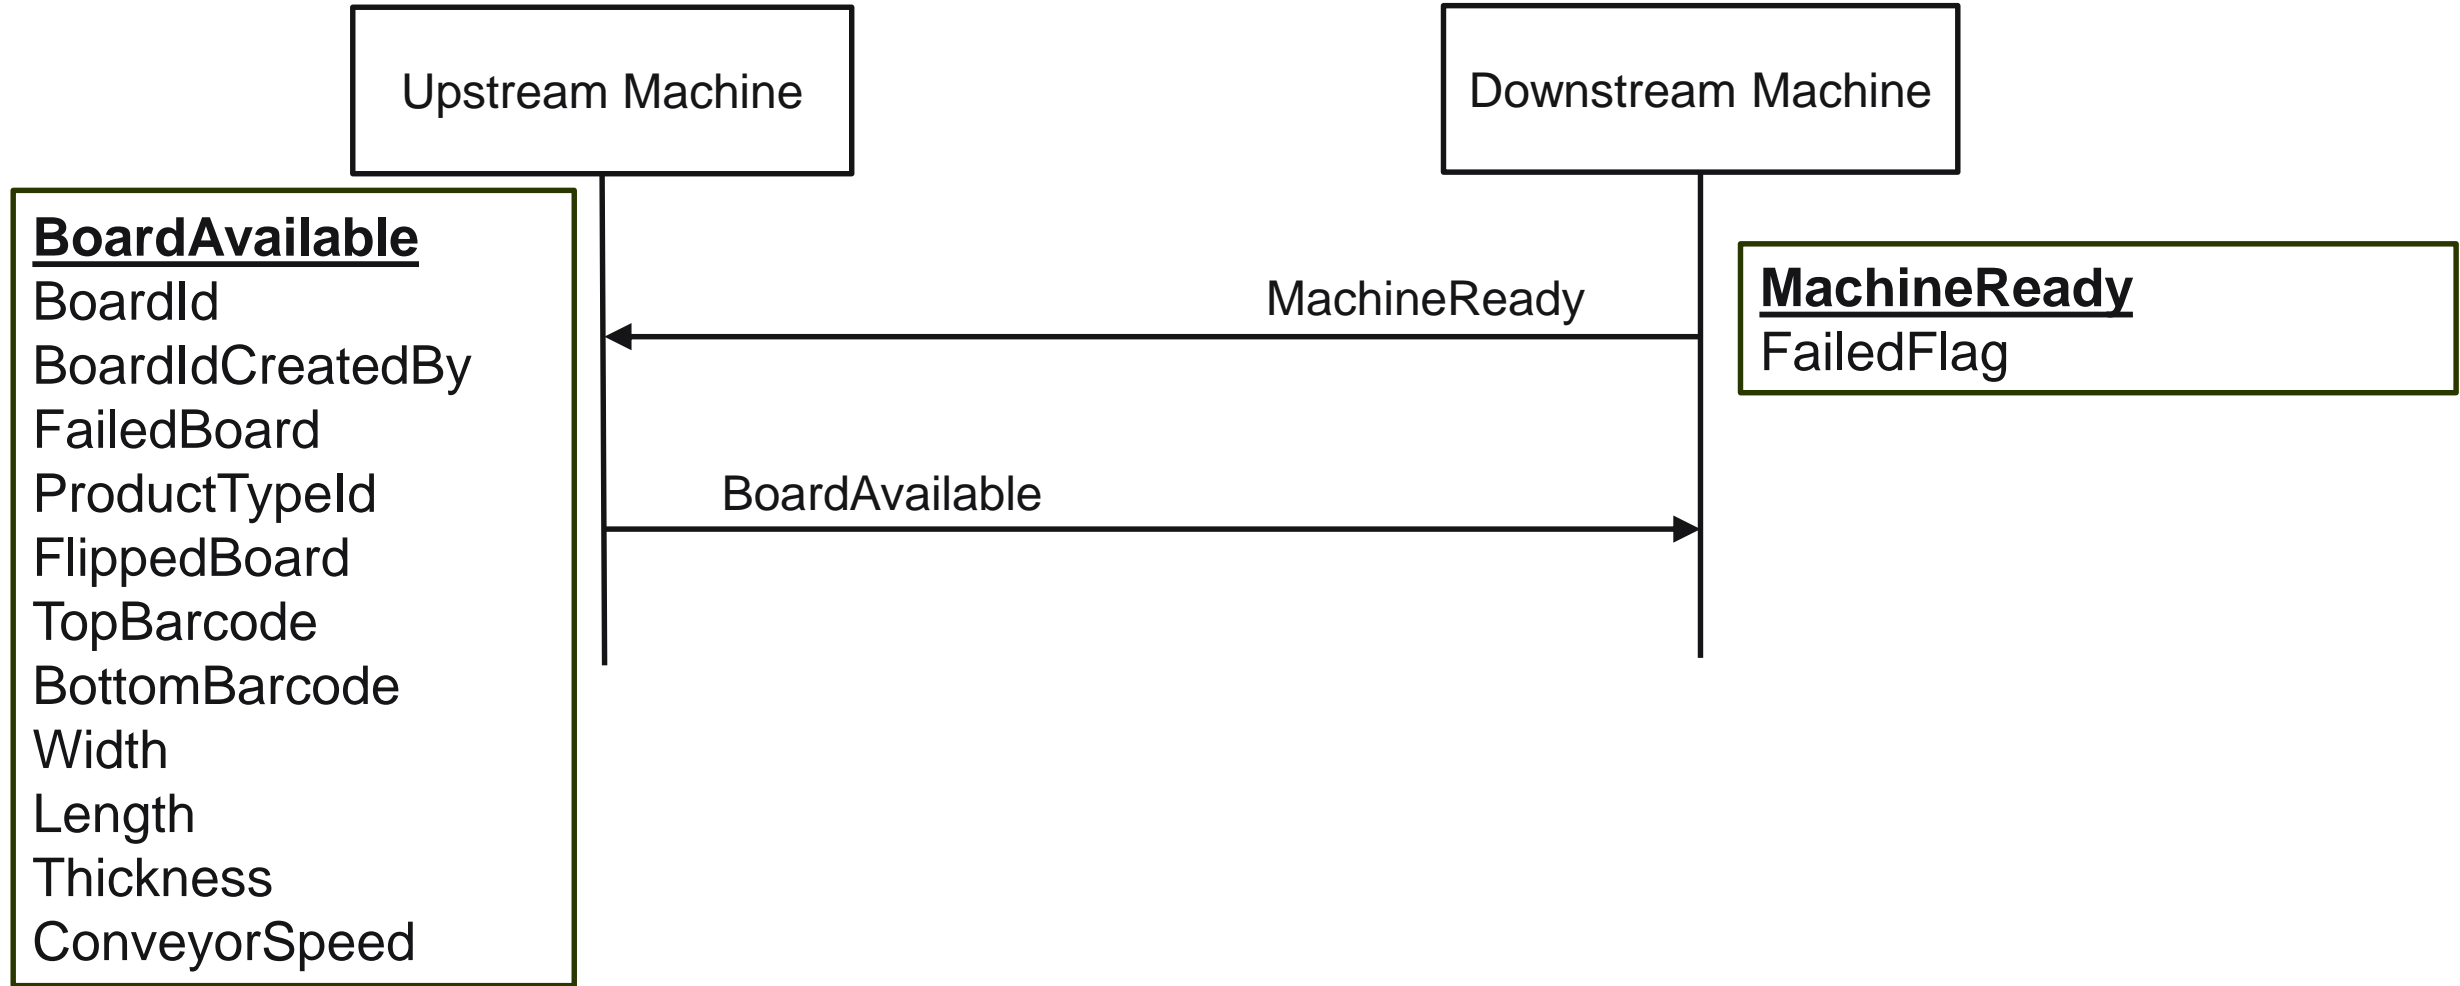

Full Process data availability, maximum line throughput & traceability.

- 1) Generic communication back bone to work even in mixed-brand equipment lines.
- 2) Product centric approach, keeping complexity under control.
- 3) Board tracking along the entire line with single board ID reading possible.
- 4) Open protocol, adaptable to further and future requirements.
- 5) Standard Interfaces (Ethernet) reduce cost and effort for installation.

The Hermes Standard protocol: "step by step"

Signalling MachineReady (downstream) and BoardAvailable (upstream)

The Hermes Standard protocol: "step by step"

What kind of data can be transmitted?

BoardAvailable	Type	Range	Optional	Description
◆ BoardId	string	GUID	no	Indicating the ID of the available board
◆ BoardIdCreatedBy	string	non-empty string	no	MachinelId of the machine which created the BoardId (the first machine in a consecutive row of machines implementing this protocol). The MachinelId is part of the Hermes configuration.
◆ FailedBoard	int	0 .. 2	no	A value of the list below
◆ ProductTypeId	string	any string	yes	Identifies a collection of PCBs sharing common properties
◆ FlippedBoard	int	0 .. 2	no	A value of the list below
◆ TopBarcode	string	any string	yes	The barcode of the top side of the PCB
◆ BottomBarcode	string	any string	yes	The barcode of the bottom side of the PCB
◆ Length	float	positive numbers	yes	The length of the PCB in millimeter.
◆ Width	float	positive numbers	yes	The width of the PCB in millimeter.
◆ Thickness	float	positive numbers	yes	The thickness of the PCB in millimeter.
◆ ConveyorSpeed	float	positive numbers	yes	The conveyor speed preferred by the upstream machine in millimeter per second

FailedBoard may be one of the following values:

- 0 Board of unknown quality available
- 1 Good board available
- 2 Failed board available

FlippedBoard may be one of the following values:

- 0 Side up is unknown
- 1 Board top side is up
- 2 Board bottom side is up

Globally Unique Identifier

eg. **123e4567-e89b-12d3-a456-426655440000**

Chances of collision are negligible

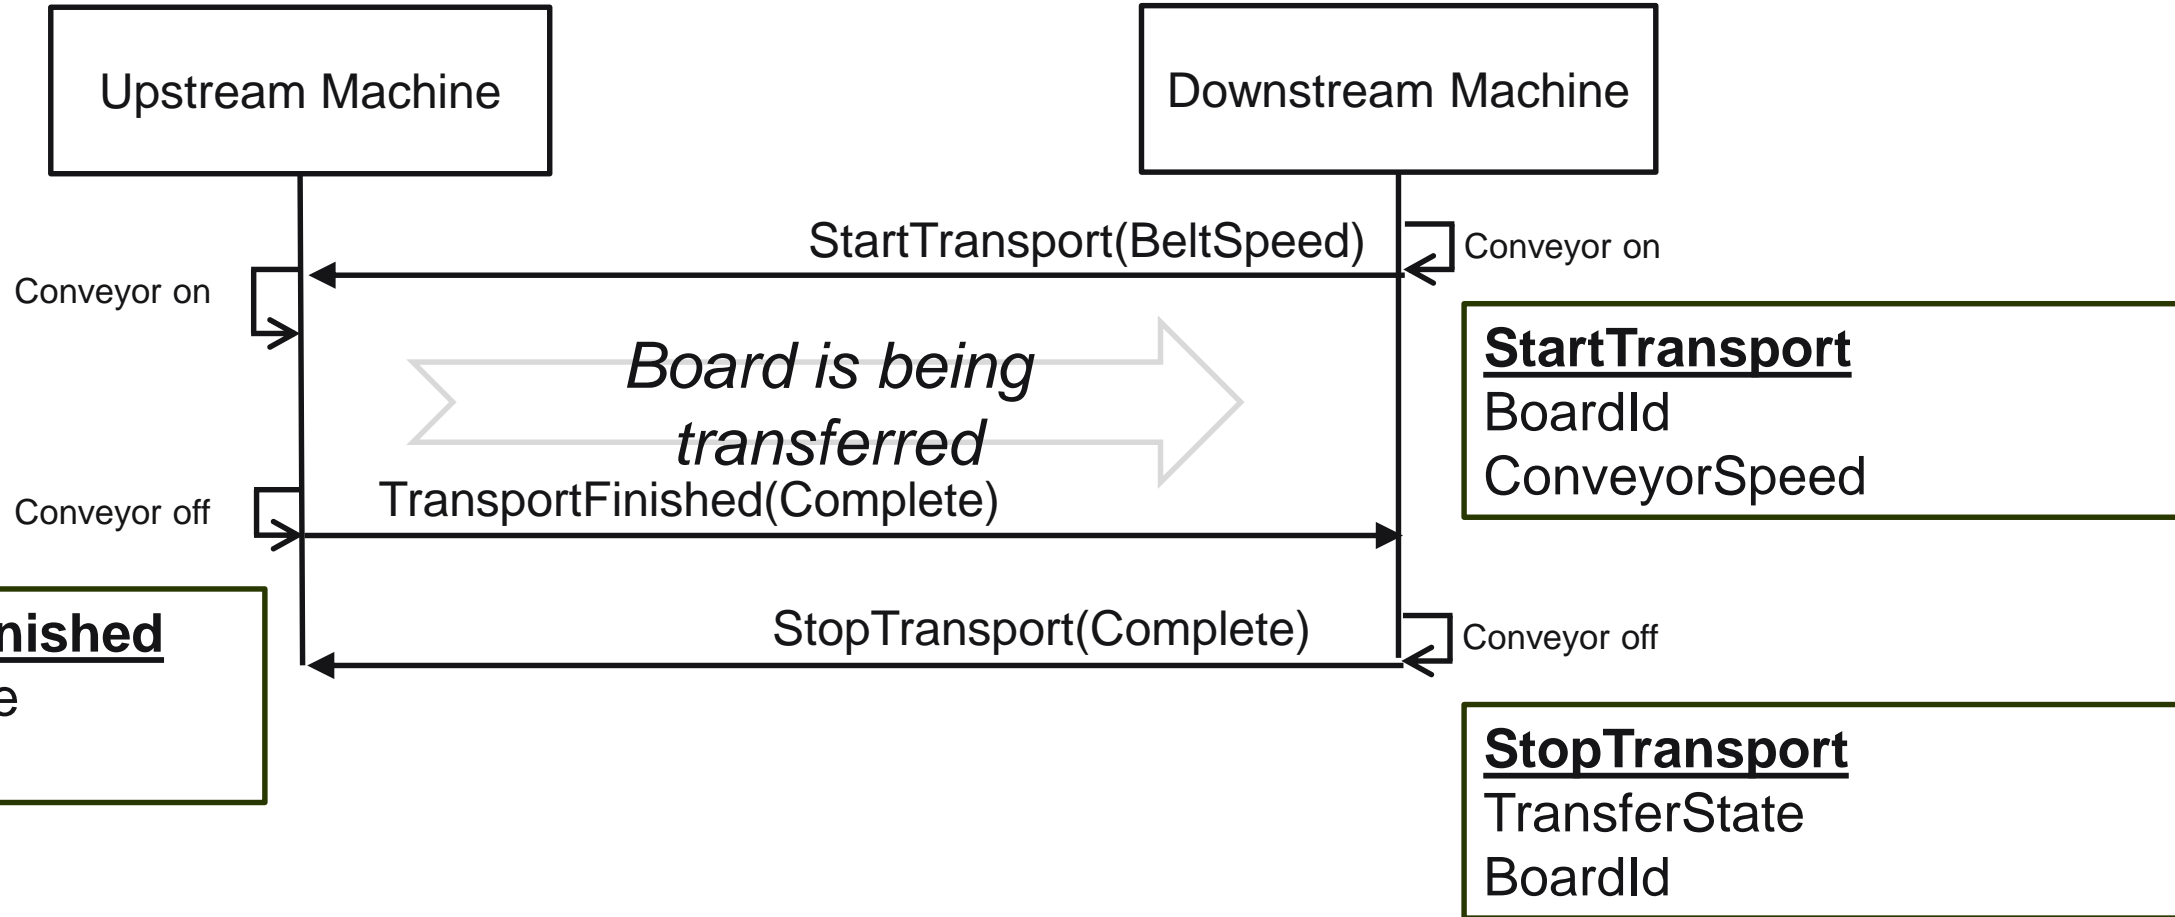

5.3×10^{36} randomly generatable GUIDs exist

Need to generate 2.7×10^{18} for a 50% collision chance

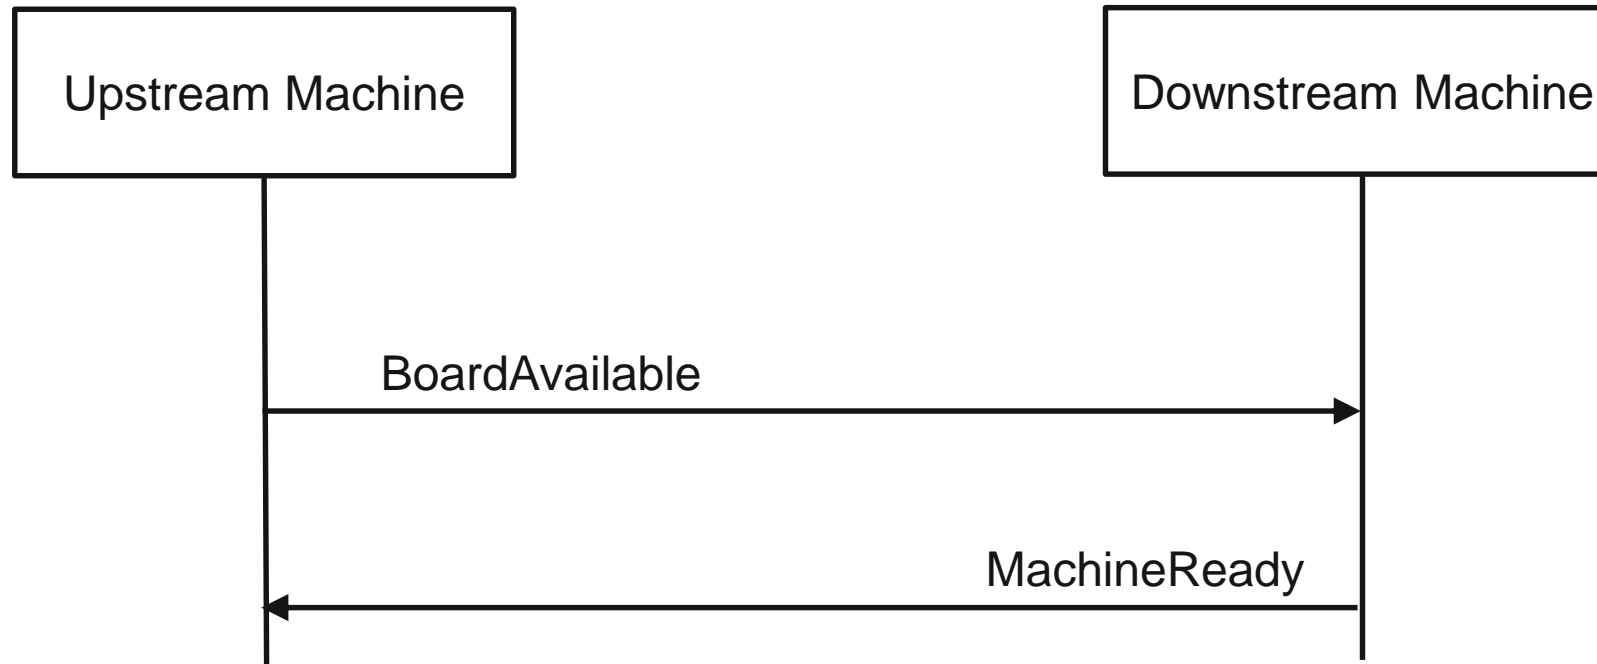

Hermes uses GUIDs as a handle to uniquely identify and track boards

The Hermes Standard protocol: "step by step"

Board Handover

The Hermes Standard protocol: "step by step" ... and so on ...

Standing on the shoulders of giants: TCP/IP and XML

TCP/IP

Reliable connection-oriented communication protocol

Provides time-out handling

XML

Tagged data to ensure compatibility with future versions of Hermes

Predefined W3C standards for date, time, representation of floating point numbers etc.

For simplicity, restricted to UTF-8 (for Hermes 1.0, this effectively amounts to ASCII).

Overhead in size irrelevant for Hermes messages

Welcome to The Hermes Standard
IPC-HERMES-9852 for M 2 M communication

**The Hermes Standard
gets everything connected.**

The Hermes Standard Introduction to The Hermes Standard Initiative

Connectivity Needs Cooperation

- **The Hermes Standard Initiative is a joint project of leading vendors of electronics assembly equipment.**
- **Active participation is open to all vendors of electronics assembly equipment.**
- **All members are equally important in a fair and open decision making process.**

The Hermes Standard Initiative

A global footprint defines a global standard

All equipment vendors are invited to join!

Clearance for vote

Version change: Minor

Service description tag:

Description *: If machines support multi-directional transport they have to provide additional upstream and downstream ports. For the return transport further HERMES channels need to be set up between several upstream and downstream ports (on one machine for the same label), the transport direction should be additionally indicated in each ServiceDescription, UpstreamConfiguration, DownstreamConfiguration.

Use cases *: Conveyor modules, Flipping stations, AOIs and other machine which support multi-directional transportation

Functionality / communication sequences: no sequence change

New / changed XML messages: New Attribute 'TransportDirection' to ServiceDescription, UpstreamConfiguration, DownstreamConfiguration

Proposed changes to standard: see attached

The Hermes Standard time line "From Zero To Hero" in under 18 months

The Hermes Standard: Core advantages in a nutshell

The new backbone for board-flow data management in Smart SMT Factories

The Hermes Standard: „Better By Design“

- The Hermes Standard will replace the current “SMEMA” Standard.
- There is only need for one board ID reader for a whole line.
- Based on well established technologies such as TCP/IP and XML, the protocol is easy to adapt to future requirements.
- Utilizing Standard components makes it inexpensive and ultimately flexible.
- Data Management and Traceability features are fully integrated.

The Hermes Standard Initiative: Open, transparent, agile.

- The Hermes Standard Initiative is open for all vendors of assembly equipment.
- Cooperation is based on clear processes and procedures.
- After only one year, about fifty companies are supporting the standard.
And the initiative keeps growing

IPC-HERMES-9852

The global standard for "M2M" in SMT assembly

APPENDIX

The Hermes Standard for vendor independent machine-to-machine communication in SMT Assembly.

Giving Evidence of current advantages

Old “SMEMA problems” versus The Hermes Standard solutions

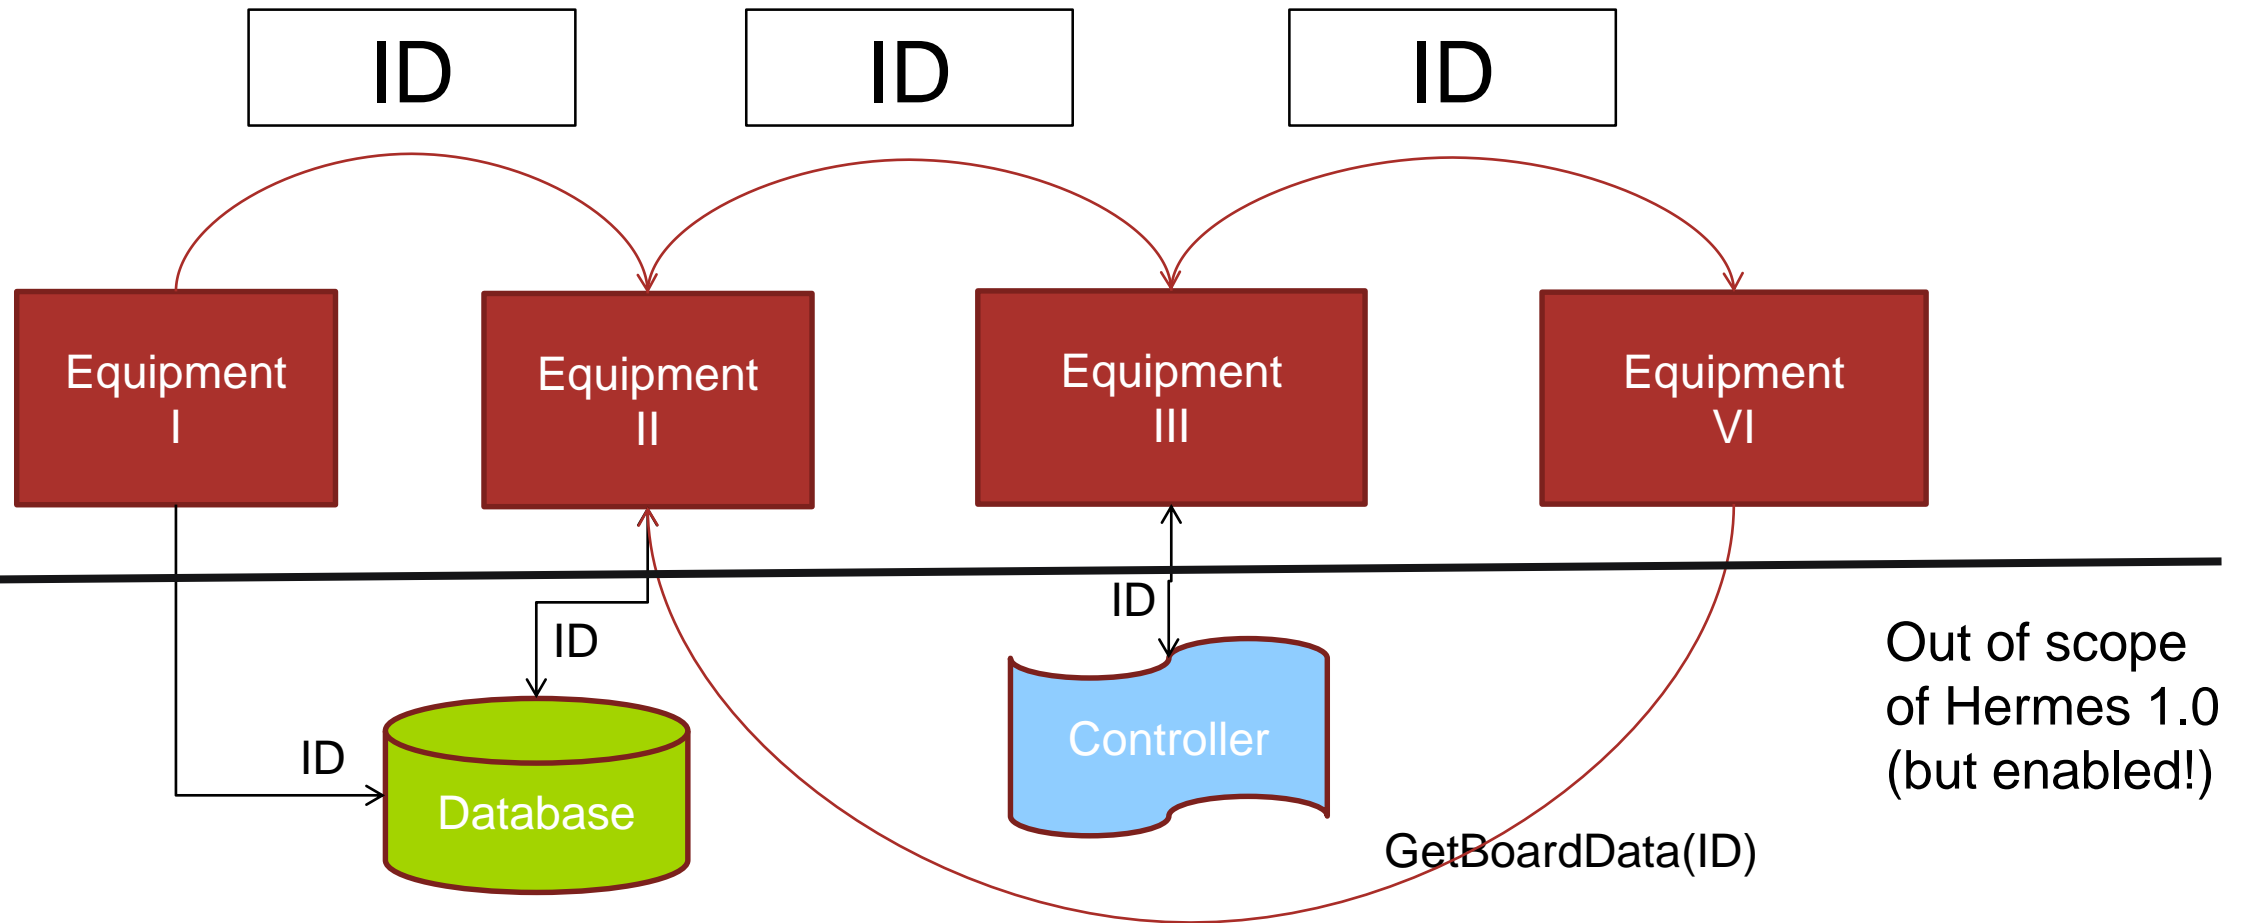

The Issue	 At SMEMA	 At The Hermes Standard (1.0)
1) Scenario definitions in the protocol	<ul style="list-style-type: none"> Several error scenarios undefined: e.g. PCB is signalled to be handed over but has not arrived because the signal “PCB arrived” is missing 	<ul style="list-style-type: none"> Most error scenarios already defined Easily expandable in future versions
2) Dealing with defective Cables	<ul style="list-style-type: none"> Variety of specified cable set makes it hard to bring the exact replacement to the site or requires broad stock. 	<ul style="list-style-type: none"> Only one standard cable type, which is easily and inexpensively available: Ethernet cables.
3) Hardware installation effort	<ul style="list-style-type: none"> Cables are “hand made” w/o standard lengths. Installation of SMEMA box & adapter Separate cables for LAN and SMEMA “Dual Lane” requires second set of entire hardware 	<ul style="list-style-type: none"> Only Ethernet port necessary No separate SMEMA cable necessary “Dual lane” required no (!) additional hardware, it is fully covered by the protocol
4) Synchronizing PCB data and hand-over message	<ul style="list-style-type: none"> Data is transfer requires separate Ethernet interface Data must be synchronized with SMEMA signals assigned to PCB Timing must match all vendors to ensure correct assignment 	<ul style="list-style-type: none"> No synchronization is necessary and no timing issues exist as data is transferred together with handover message. Implementation of transferring data between different vendors very easy.
5) Flexibility at changing line configurations	<ul style="list-style-type: none"> Specific cable length is necessary, therefore any change in the line configuration leads to new cabling 	<ul style="list-style-type: none"> Standard Ethernet cables: Easily available and specific length is not required.

The naïve approach to data transfer

Hermes transfers keys (unique ID, barcode), not data

Out of scope
of Hermes 1.0
(but enabled!)

Hermes: Peer to Peer or Client-Server?

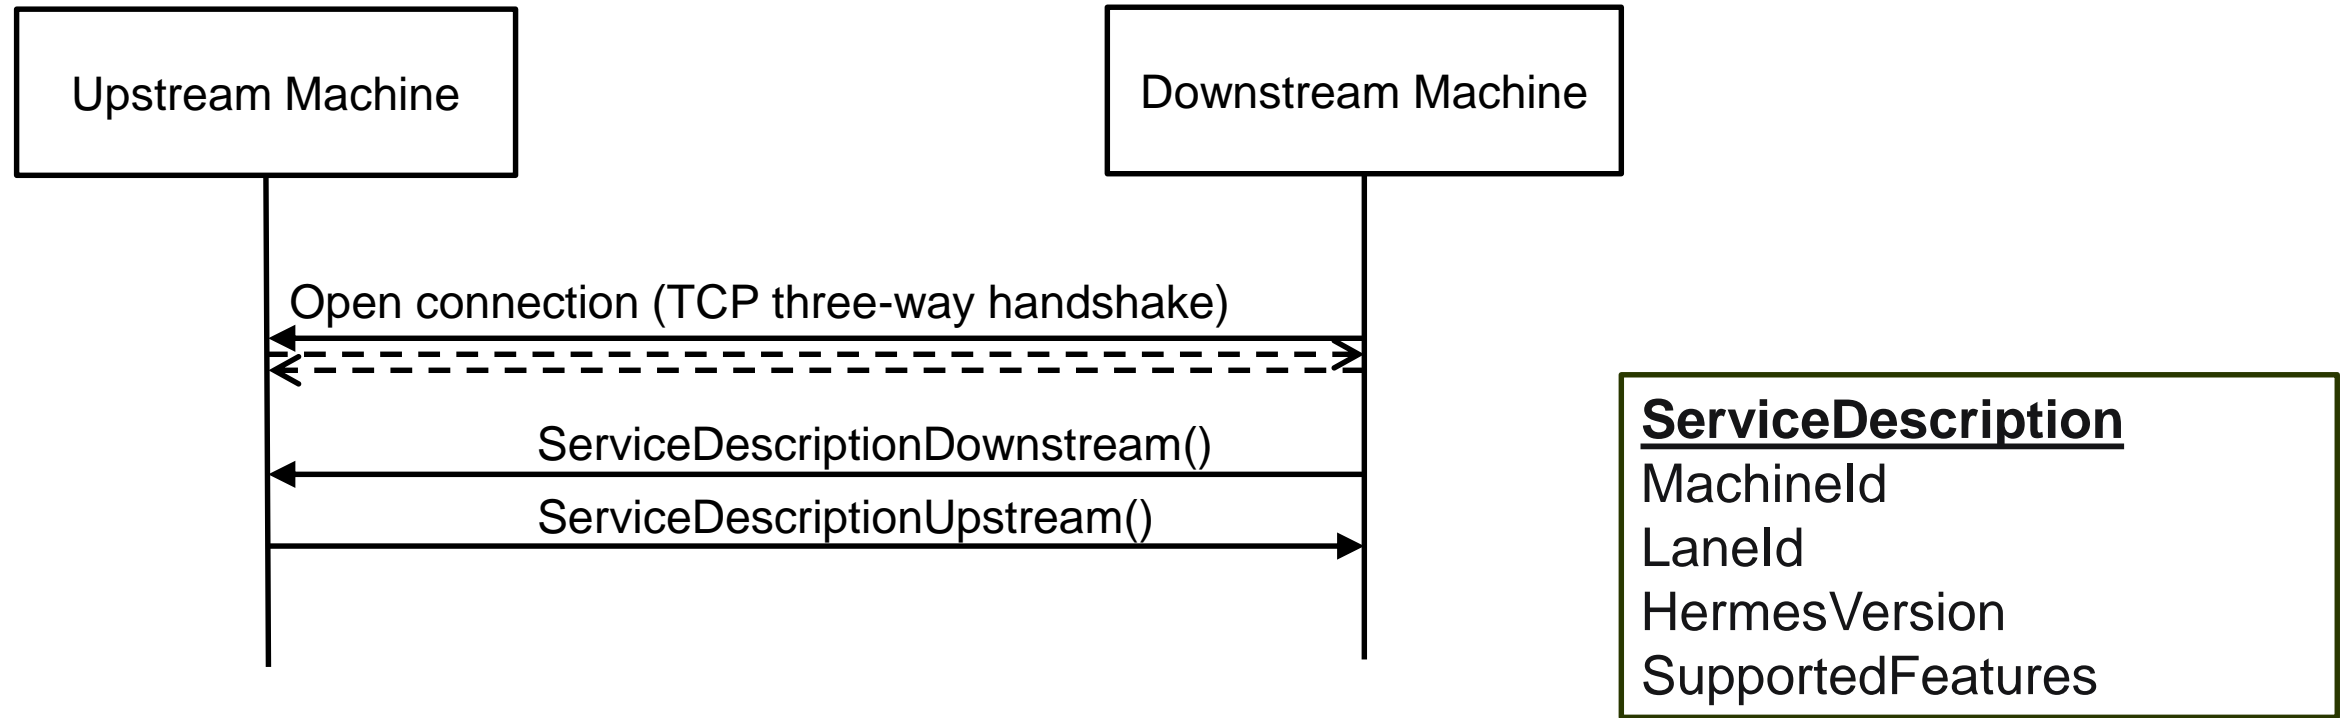

The Hermes Standard facilitates a Server („Man in the Middle“) in order to

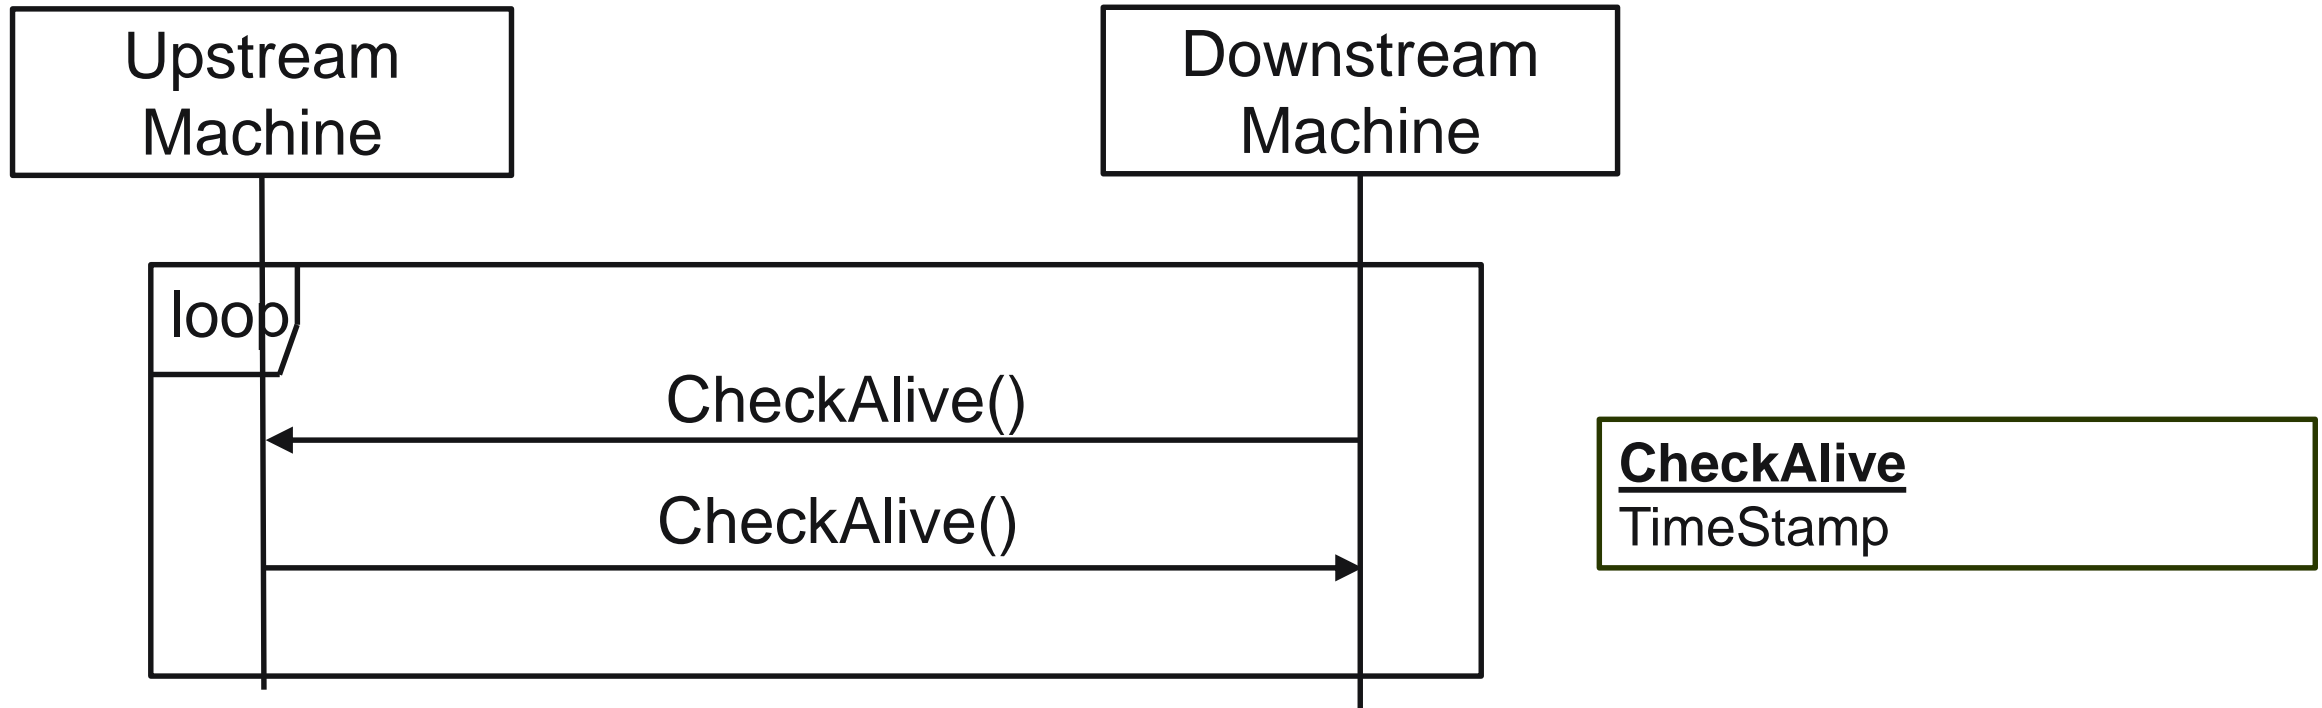

- route through different network segments
- track the board flow
- intercept the board flow

Hermes step by step

I: Establishing the connection from down- to upstream

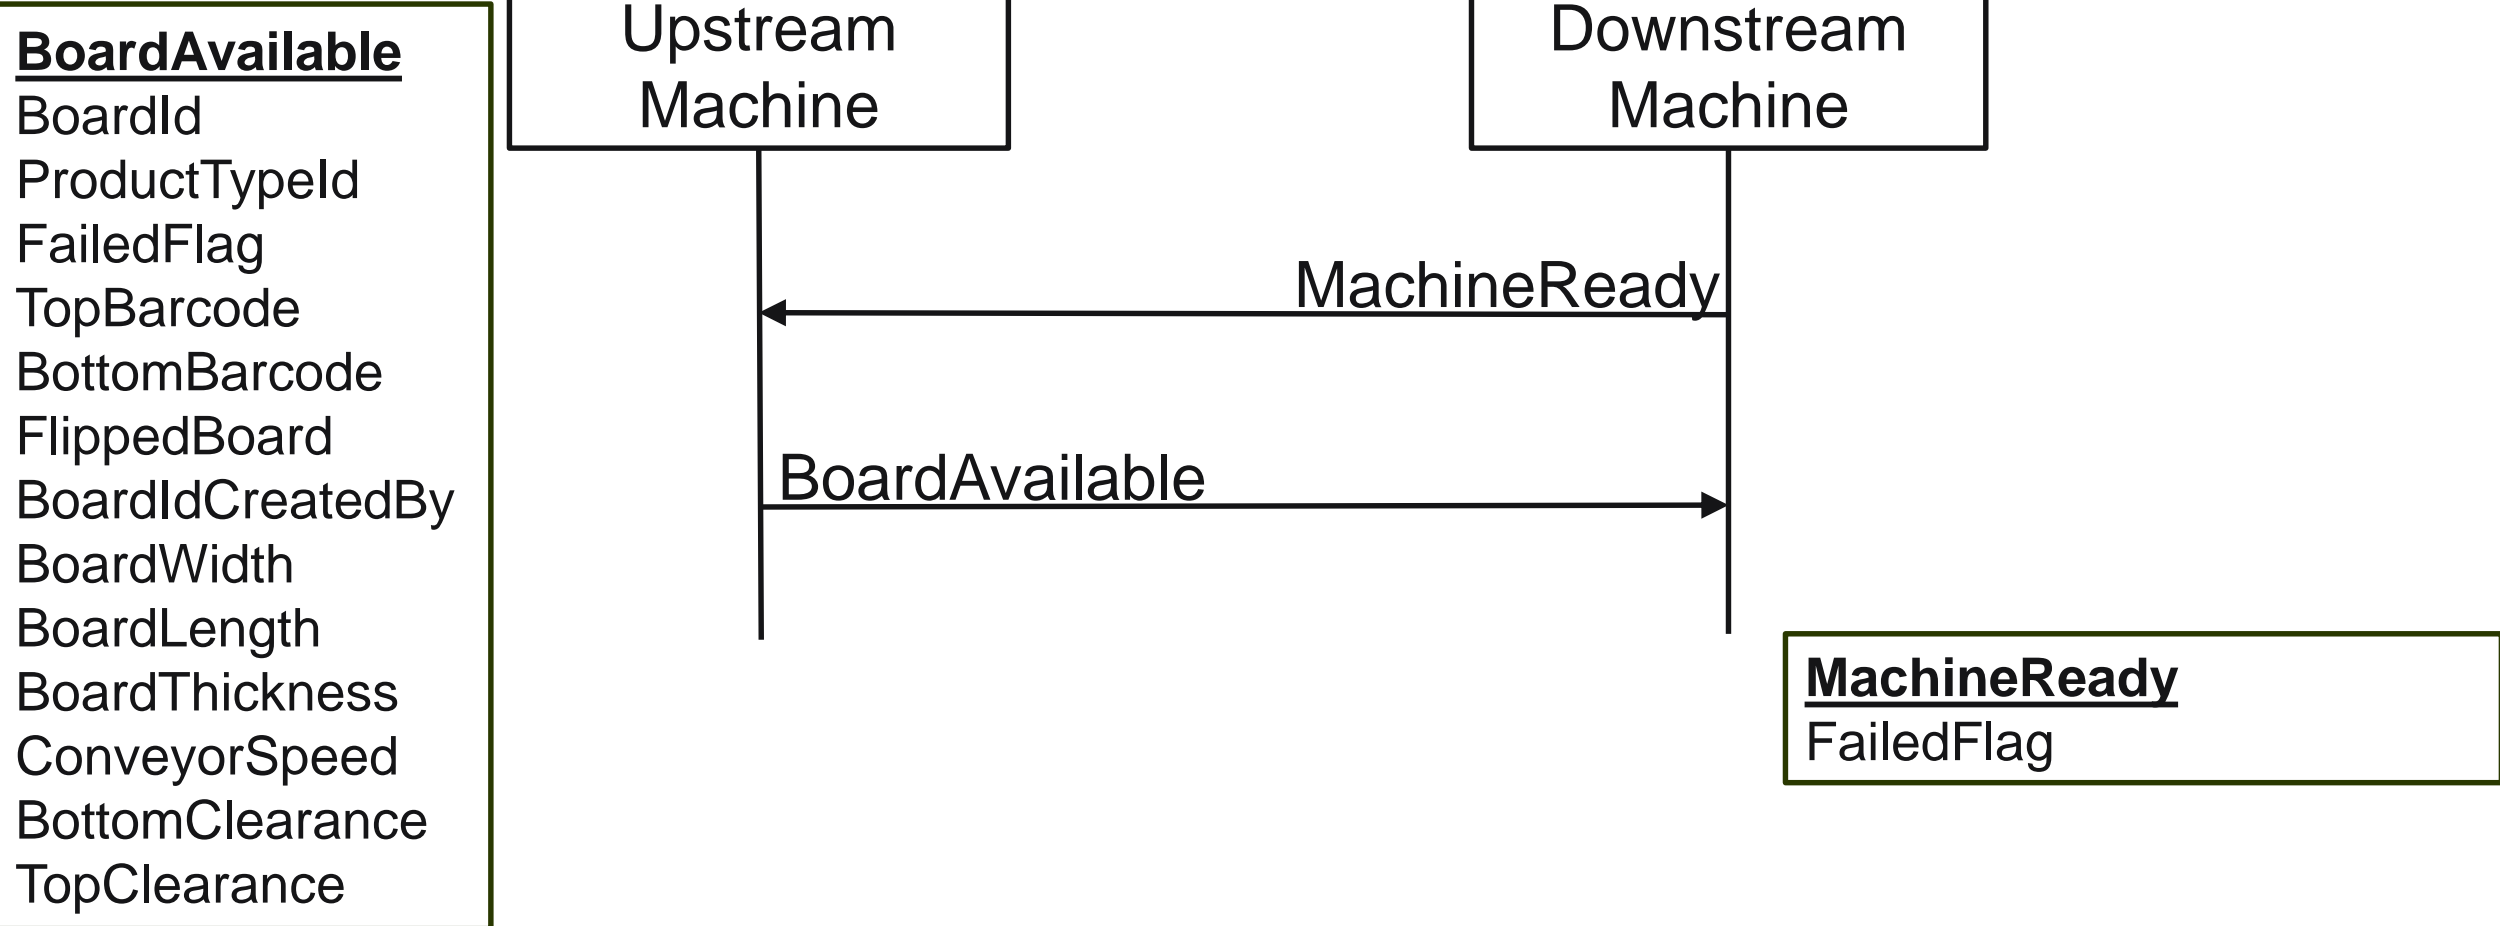

Hermes step by step II: Exchanging CheckAlive messages

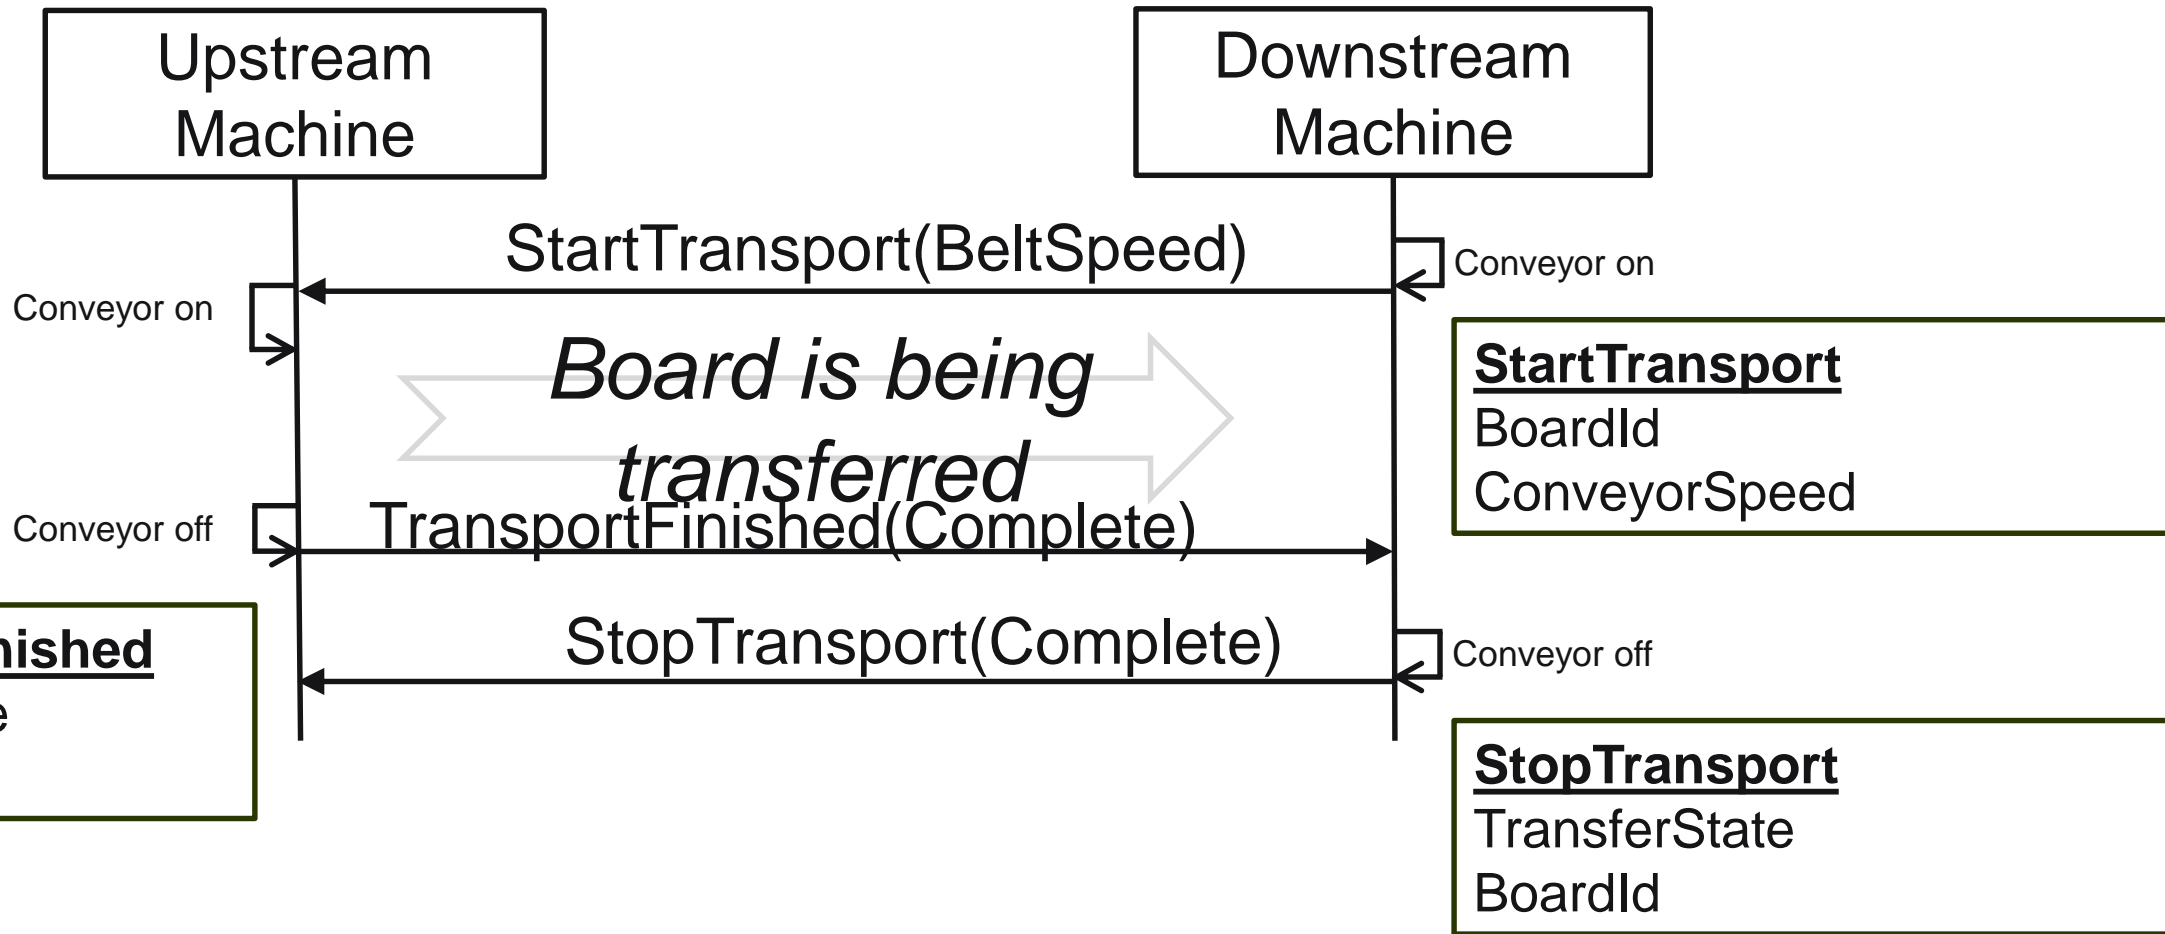

Hermes step by step

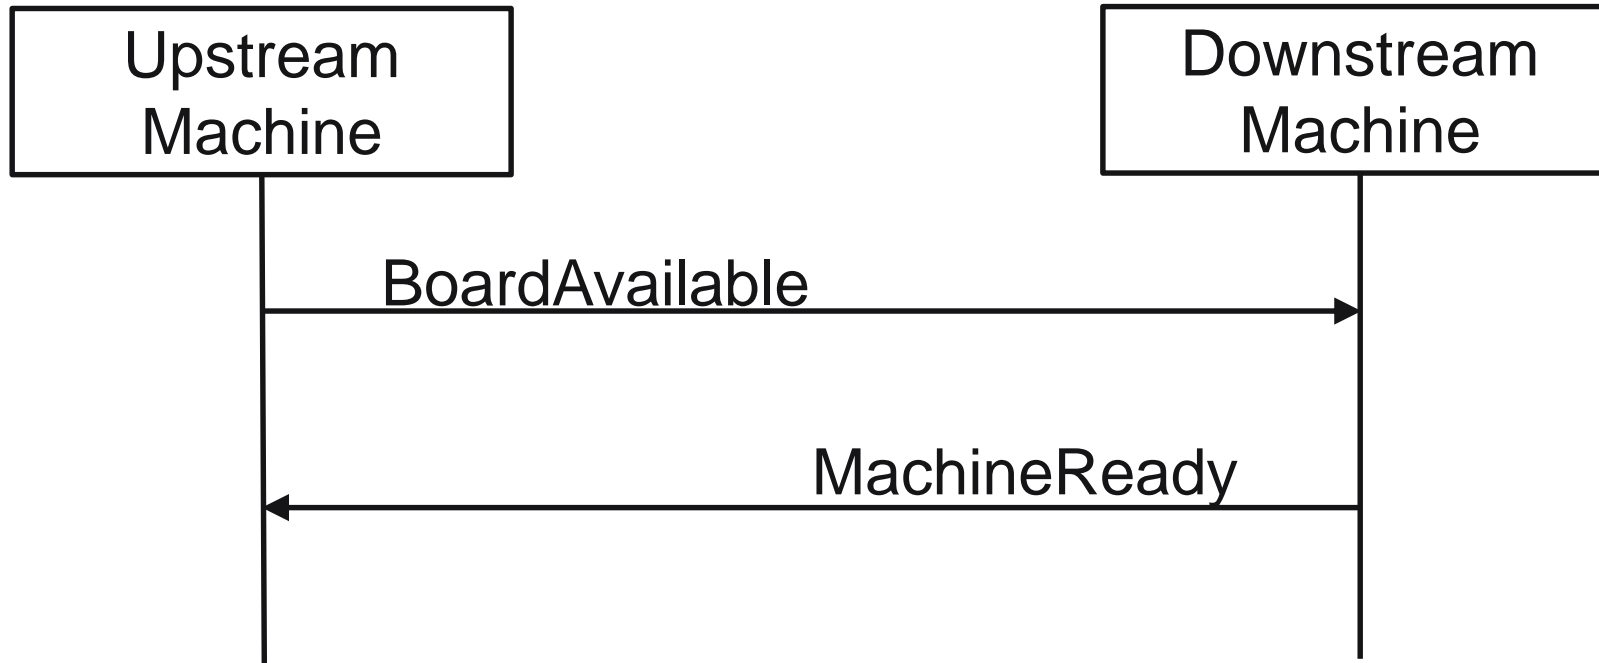

III: Signalling MachineReady (downstream) and BoardAvailable (upstream)

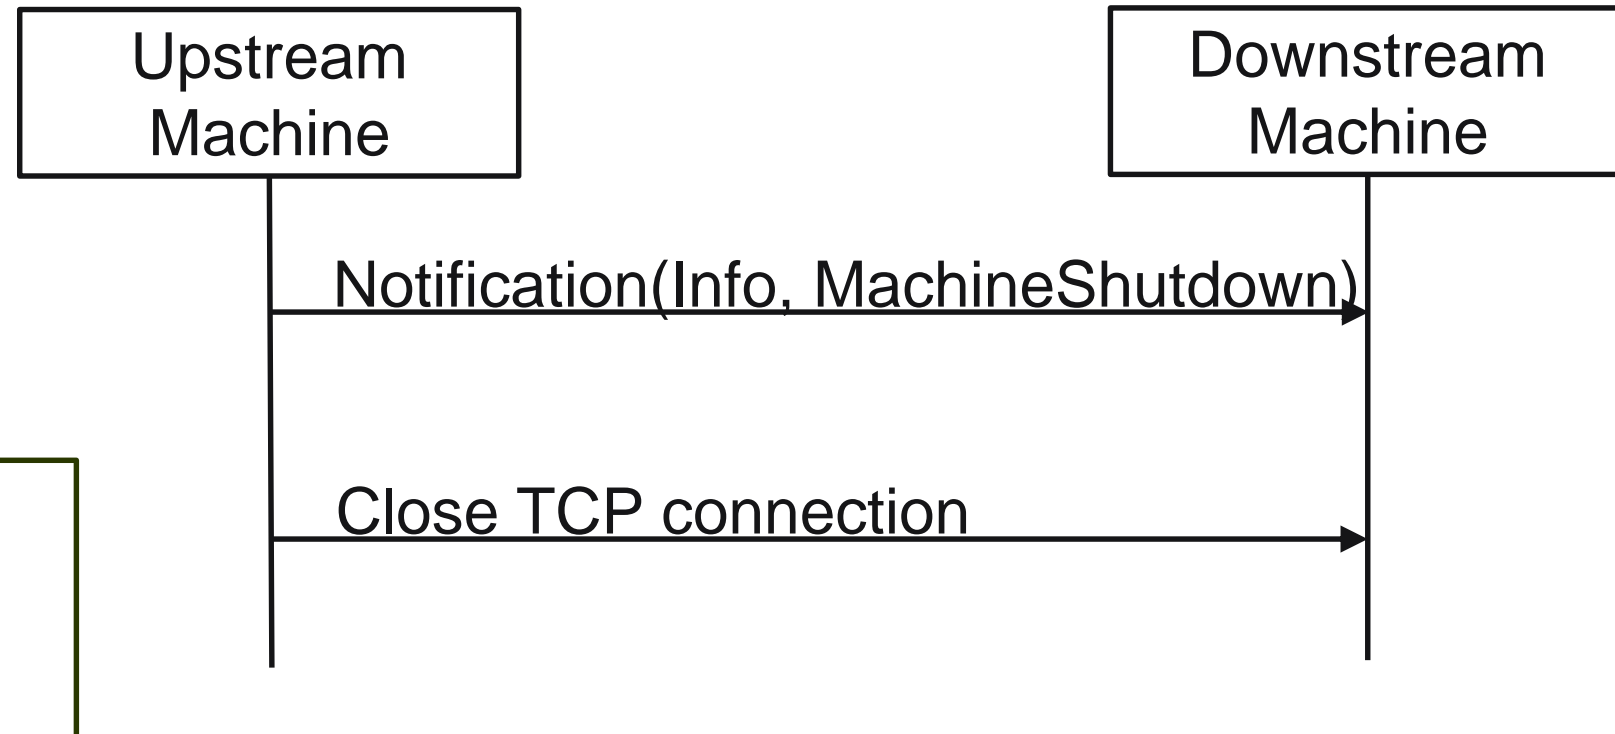

Hermes step by step IV: Board handover

Hermes step by step V: and so on ...

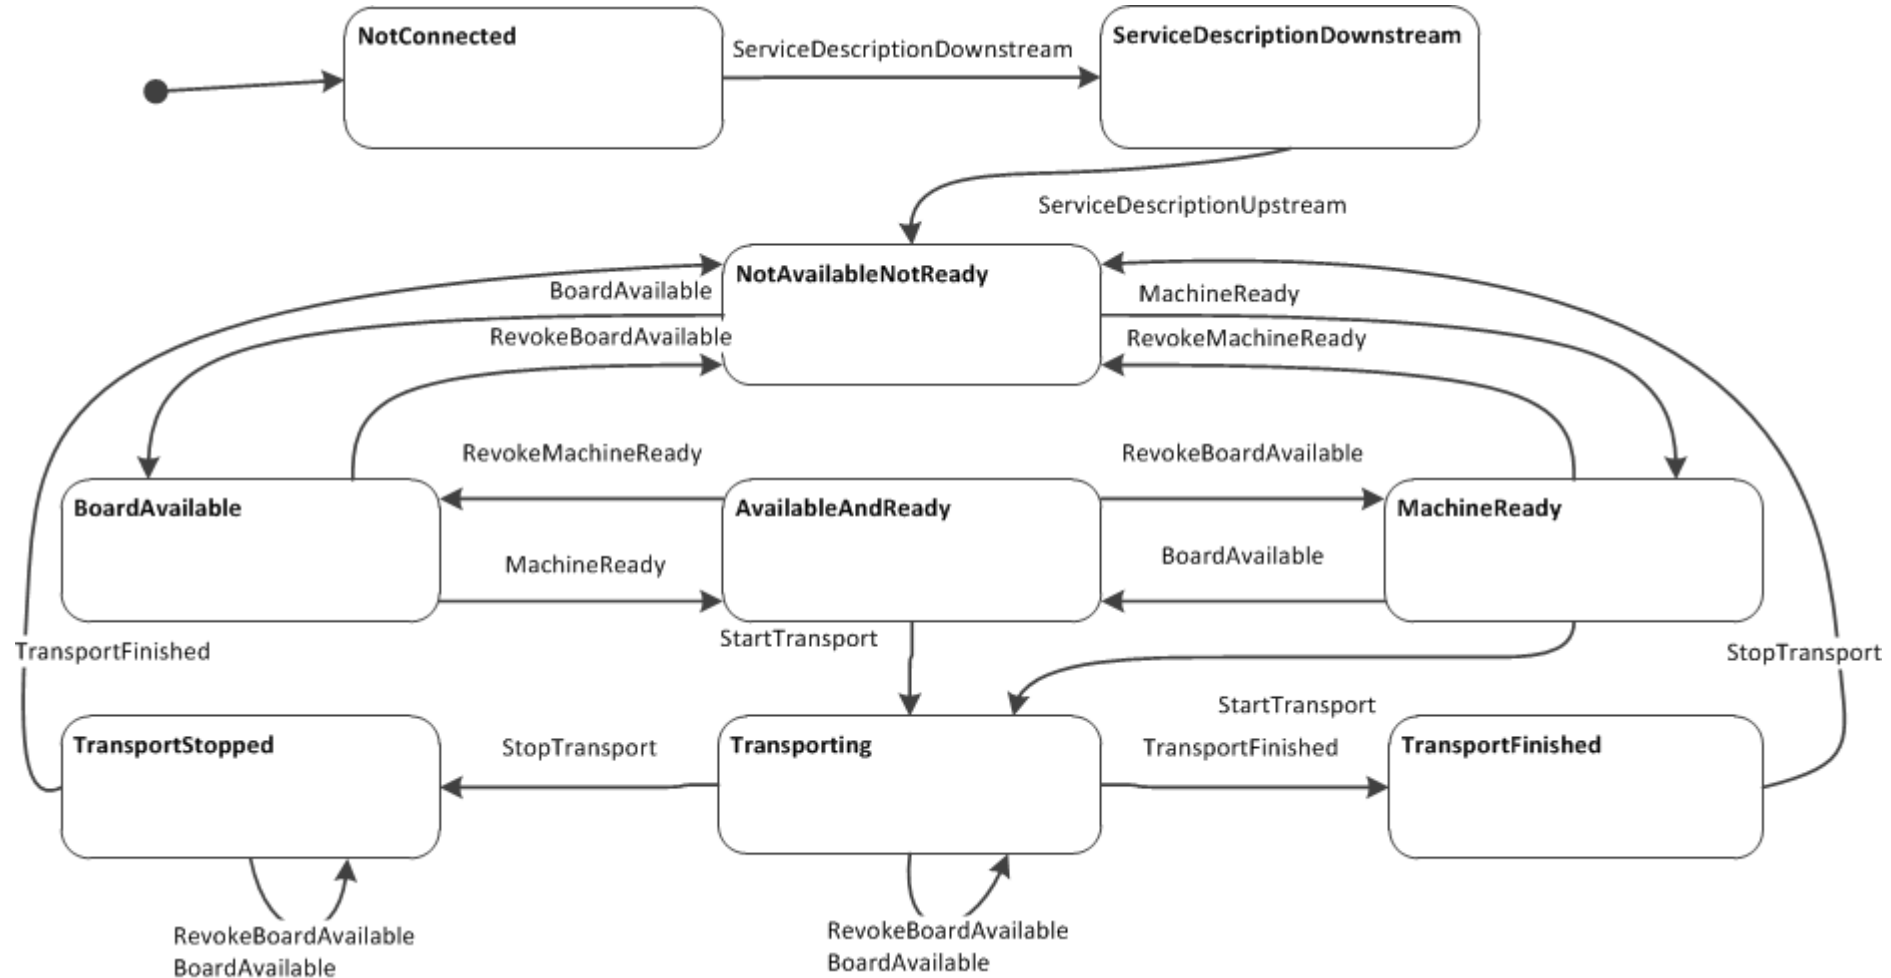

Hermes step by step VI: Graceful shutdown

IPC-HERMES-9852
The global standard for "M2M" in SMT assembly

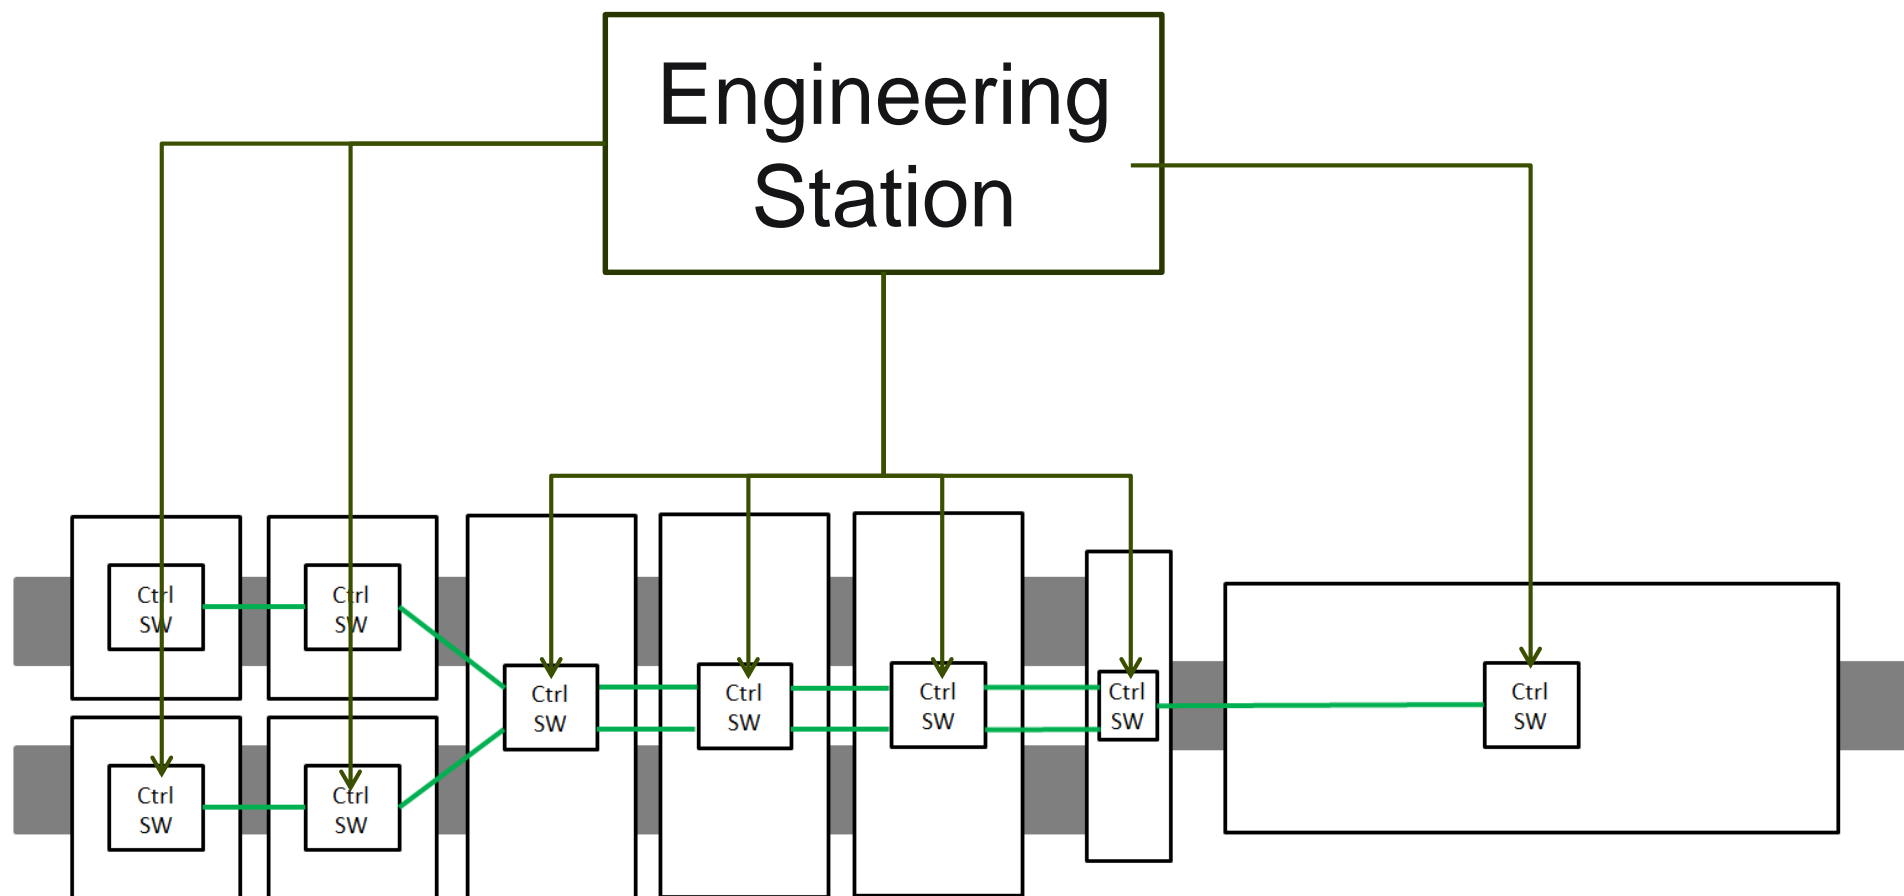

The Hermes Standard state chart

IPC-HERMES-9852
The global standard for "M2M" in SMT assembly

Hermes Configuration (I)

Hermes Configuration (II)

To ensure easy and fast configuration, The Hermes Standard protocol defines configuration messages

SetConfiguration

Used to configure the Hermes interfaces of a machine

GetConfiguration

Used to read out the configuration of the Hermes interfaces

CurrentConfiguration

Response to a GetConfiguration-Message

Hermes Configuration (III)

SetConfiguration

```
<Hermes Timestamp="2017-03-22T13:20:30.452">
  <SetConfiguration MachineId="TRM01">
    <UpstreamConfigurations>
      <UpstreamConfiguration UpstreamLaneId="1" HostAddress="192.168.1.2" Port="50101" />
      <UpstreamConfiguration UpstreamLaneId="2" HostAddress="192.168.1.2" Port="50102" />
    </UpstreamConfigurations>
    <DownstreamConfigurations>
      <DownstreamConfiguration DownstreamLaneId="1" Port="50101" />
      <DownstreamConfiguration DownstreamLaneId="2" ClientAddress="192.168.1.4" Port="50102" />
    </DownstreamConfigurations>
  </SetConfiguration>
</Hermes>
```

IPC-HERMES-9852
The global standard for "M2M" in SMT assembly

Removing and re-inserting a board in an SMT assembly line

- The repair station creates a new BoardId and attaches the scanned barcode to it. An MES correlates the old and new BoardId and merges the various pieces of information.
- The repair station queries the MES via barcode for the associated BoardId . Board handover continues using the old BoardId .
- The repair station prompts the user to confirm that the inserted board is the one that was removed.
